

Ransomware Protection from the Inside Out

How Canauri™ works

1.

Ransomware monitoring on network (all endpoints)

2.

Ransomware (encryption) detected

3.

Endpoint isolated automatically

4.

Administrator is notified via SMS & Email

Deception Technology

Canauri™ seeds the network with files, creating a trap to detect ransomware. These bait files quickly detect the attack and trigger proactive steps to shut down the attack.

Signature-less detection

Traditional antivirus relies on a signature to detect a threat, which limits the response to known attacks. Canauri™ uses the encryption process itself to detect and stop the attack.

Stopped in milliseconds

The unique detection and response algorithms of Canauri™ have proven to stop a ransomware attack in milliseconds, preventing business downtime and recovery from the attack.

Last line of defense

Designed to keep you *left of boom*, Canauri™ works in your existing stack and adds a last line of defense layer of security against an unavoidable threat.
